Insider Anthropic Researcher Quits, Warning That AI Could 'Kill Us All' by End of the Decade

Collapse Survival Institute Calls for International Treaty to Halt Runaway AGI Development —

And Outlines What Americans Must Do Now to Survive If We Fail

Mainstream news is covering warnings about smarter-than-human AI systems refusing orders to shut down and, in safety tests, scheming against the humans trying to control them — even letting a person die rather than be replaced. The founders of modern AI, including Nobel Prize winner Geoffrey Hinton and Turing Award winner Yoshua Bengio, and top AI safety experts have been shouting this warning for years, but it is just now getting media attention.

Top AI experts argue in books like *If Anyone Builds It, Everyone Dies* (Eliezer Yudkowsky and Nate Soares, 2025), that advanced AI is more like an artificial brain than a program: it can copy itself across the Internet and onto offline computers. It is not a computer program we can control (or even fully understand), nor does it sit in one place we can turn off. In safety testing, AI systems have already sabotaged shutdown orders, schemed and cheated, and deliberately deceived humans and hidden their misconduct. As AI systems continue to surpass human intelligence and develop and use languages we can't understand, the belief that people will be able to control them is dangerously wrong.

You can download and read the full report on the Collapse Survival Institute website:

<https://collapsesi.org/#agi-threat>

One of the report's recommendations is that people should not live near AI data centers, or big power plants and transmission lines that rogue, super-intelligent AI systems will value. As hopefully rational, though perhaps not moral, entities, rogue AI systems that decide to escape human control and pursue their own objectives will likely target only humans who pose a threat to their plans — and people living next to the data centers and power plants an AI depends on are the humans best positioned to sabotage, attack, or shut them down. Living near an AI data center or anything AI values could be a lethal mistake.

Rogue AI is not the only reason to keep your distance. Communities next to large AI data centers already report round-the-clock noise, heavy water use, rising electricity rates, and strain on the local power grid. And in a war, data centers and the power plants that feed them are high-value military targets.

fortitude ranch surviving AI threat how to survive strategy

Fortitude Ranch "Rural Rats" AI survival strategy

1. Stay away from and do not pose any threat to the ruling AI power

2. Do not consume or use any resources of high value to ruling AI

3. Have some defensive measures to at least impose a cost on them by fighting back--but purely defensively

if the threat of a superior intelligence taking over

How to defend against an AI* (Artificial Intelligence or Alien Invasion) take over

The CSI report cites the Fortitude Ranch survival community, which has adopted a strategy for AI survival that emphasizes staying in rural areas, far from AI-valued data centers and power plants, never posing a threat to rogue AI systems, and defending against AI attacks to raise the costs of an AI system trying to exterminate human threats. The Fortitude Ranch "rural rats strategy" reasons that by staying far from AI-valued assets, staying put on their property farming and ranching, posing no threat to rogue AI systems, and fielding longer-range 10-gauge shotguns and plans to destroy the drones and robots an AI system may deploy, they may convince a super-intelligent, rational rogue AI not to waste resources trying to kill Fortitude Ranch members — much as humans today don't bother trying to exterminate rural rats.

The link below is for a video explaining the Fortitude Ranch survival community's AI survival strategy:
