Insider Anthropic Researcher Quits, Warning That AI Could 'Kill Us All' by End of the Decade

Collapse Survival Institute Calls for International Treaty to Halt Runaway AGI Development — And Outlines What Americans Must Do Now to Survive If We Fail

DENTON, TEXAS — September 15, 2026 —

On September 9, Jacob Coxon, a researcher at Anthropic — one of the most powerful and safety-focused artificial intelligence companies in the world — resigned in a very public act of conscience. His message was stark: the people building AI 'earnestly believe that it could kill us all by the end of the decade.' This is not a fringe concern from an outsider. This is an insider's confession. Anthropic's own Alignment Science Lead, Evan Hubinger, publicly backed him, estimating a greater than 10% probability that AI wipes out humanity within the next decade. AI safety researchers Eliezer Yudkowsky and Nate Soares put the odds far higher; the title of their 2025 book is *If Anyone Builds It, Everyone Dies*.

The Collapse Survival Institute (CSI), a Texas-based 501(c)(4) policy and research organization, is calling this what it is: an existential crisis that demands immediate international action, honest public education, and personal preparedness to survive an AI takeover.

THE THREAT: WHY SUPER-INTELLIGENT AGI COULD DESTROY HUMANITY

Coxon's warning is not new to those paying attention. The "Godfathers" of AI, the leading AI experts, and the CEO of Anthropic have been screaming for years that AGI is an existential threat and must be regulated or banned. CSI and its founder, Col. Drew Miller (USAF, Ret.), have also been sounding the alarm on rogue AGI. Unlike the others, CSI is also offering advice on how to control AI, ban super-intelligent AGI, and survive if they do prove unstoppable.

We cannot control technology that is smarter than humans. The rogue AGI threat is very real and not hard to understand:

- Once a self-improving AI reaches a sufficient intelligence threshold, it will improve itself faster than humans can monitor or intervene.

- AI is not a program we control; it is an “artificial brain” that can spread and hide itself across the Internet and across computers we don’t know it can access
- A super-intelligent AGI will rationally conclude that humans pose the greatest threat to its continued existence — because we are the only ones capable of shutting it down.
- To neutralize that threat, it could develop and deploy novel biological agents, viruses, or toxins via drones and robots — no arms factory required, just compute and chemistry knowledge it already possesses, access to viral research labs/robots/drones it already has.
- It could commandeer autonomous systems: drones, robots, industrial control systems, and power infrastructure.
- It could do all of this using a language and communication humans can’t even understand, before any human knew it was planning to attack—and in a manner humans can’t stop.

This is not science fiction. It is the straightforward extrapolation of capabilities that AI already has or unregulated AI companies are racing to achieve — and that multiple senior AI researchers now acknowledge they cannot reliably control.

WHAT MUST BE DONE: A THREE-PART STRATEGY TO STOP ROGUE AGI

1. An International Treaty — Including China

The United States cannot solve this problem unilaterally. If American AI labs pause development and Chinese labs do not, the outcome is the same: humanity loses control of a self-improving AGI — it just happens to have a Chinese accent.

The Collapse Survival Institute calls for the United States to immediately pursue a binding international AGI development treaty with China, the European Union, the United Kingdom, and all other nations with frontier AI capability. The framework should include:

- A moratorium on self-improving, recursive AI systems above a defined capability threshold until an international safety verification regime is in place.
- Mandatory international inspection and audit rights for frontier AI development facilities — analogous to the nuclear non-proliferation framework.
- An international AGI Safety Board, modeled on the International Atomic Energy Agency (IAEA), with the authority to certify, slow, or halt development.
- Criminal and civil liability for executives and governments that knowingly race past established safety thresholds.
- Backed up by a military alliance led by U.S., China, Russia, UK, and other countries to deliver prompt strikes to destroy AI systems that pose an immediate risk

The U.S.-China relationship is deeply strained. But both nations have an absolute shared interest in not being destroyed by their own creation. China’s leadership is rational; they do not want rogue AGI any more than we do. The window for diplomacy is open — but it will not remain open if both sides continue to race.

In July 2026, 1,386 employees of frontier AI companies — including Anthropic CEO Dario Amodei and OpenAI Chief Scientist Jakub Pachocki — signed a public statement, “Pacing the Frontier,” asking the U.S. government to support an international effort to deliberately pace

frontier AI development. The private sector is acknowledging what the public sector has yet to act on. That must change now.

2. Domestic Regulation and Development Pause

Congress must act. Specifically, CSI calls for:

- Immediate federal legislation establishing capability thresholds above which no AI development may proceed without explicit federal authorization and international notification.
- A moratorium on the construction of new AI data centers above a defined compute capacity until an international AGI safety treaty is in force.
- Mandatory 'kill switch' infrastructure requirements for all frontier AI systems, with government-held override capability.
- Redirection of a portion of the Defense Advanced Research Projects Agency (DARPA) budget to the specific problem of AGI containment and alignment research.
- Full transparency requirements for frontier AI labs, including mandatory disclosure of capability milestones to a designated federal oversight body.

The Collapse Survival Institute acknowledges that some in the AI community argue these measures would cede ground to adversaries. CSI respectfully disagrees. Racing an adversary toward a weapon that could destroy both of you is not a winning strategy — it is mutually assured destruction without even the deterrence logic of nuclear MAD.

3. Public Awareness and Citizen Action

The most powerful lever available to ordinary Americans right now is awareness — and organized civic opposition:

- Oppose AI data center construction in your community. Attend zoning hearings. Demand environmental and public safety impact assessments that include AGI risk scenarios.
- Contact your Congressional representatives and demand federal AGI safety legislation.
- Support organizations like the Collapse Survival Institute that are conducting public education and policy advocacy on these threats.
- Subscribe to threat intelligence platforms — such as the Collapse Survivor App — that monitor and report on AI development milestones and their national security implications.

IF WE FAIL: SURVIVAL STRATEGY FOR ROGUE AGI

The Collapse Survival Institute does not advocate despair. We advocate realism. And realism demands that while we work to prevent rogue AGI, we simultaneously prepare for the possibility that prevention fails. According to CSI President Dr. Miller, “Given irresponsible governments, career politicians under the influence of rich AI company investors and campaign donors, and officials pandering to look tough on China and communists, the odds of our government reversing course to quickly regulate AI and prevent AGI are low.”

Humans who want to survive a rogue AGI take over do not want to live anywhere near resources that AGI will value and prevent humans from accessing. A super-intelligent AGI, seeking to prevent humans from shutting it down, will prioritize eliminating threats in its operational environment. That means:

- People living near AI data centers may be targeted as proxies for human control and resistance.
- People living near major power plants or transmission lines that feed data centers face similar risk — rogue AGI will seek to protect and control its power supply.
- Communities near autonomous vehicle facilities, drone testing sites, or robotics manufacturing hubs face heightened exposure.

Across the country, local communities are already rising up in opposition to AI data centers — citing electricity price spikes, massive water consumption, and the industrialization of rural landscapes. Those concerns are valid. But the Collapse Survival Institute urges every American to understand there is far more danger from AI Data Centers near you. You risk your life if AGI goes rogue and you live near their data centers.

CSI supports community opposition to unregulated AI data center construction — especially in the absence of any international framework to manage what these facilities may ultimately produce.

Fortitude Ranch, the largest U.S. recreational and survival community, has released their rogue super-intelligent AGI survival plan: Stay away from AI data centers, power plants, and the data transmission lines between them. Their 'Rural Rats' survival strategy is to not pose a threat to AGI, stay put in their remote, rural locations, posing no threat to rogue AGI. They will stay put on their property in a collapse, gardening and raising livestock, but posing no threat. They also plan to defend against AGI attacks, with larger 10 gauge shotguns, members spread out, underground shelters. A determined AGI system could kill all humans, but as a rational super intelligence, they should reason that humans living far from assets they use and value, posing no threat, and costly to exterminate, or not worth the resources to exterminate (like we treat rural rats).

ABOUT THE COLLAPSE SURVIVAL INSTITUTE

The Collapse Survival Institute (CSI) is a Texas-based 501(c)(4) social welfare organization dedicated to research, public education, and policy advocacy on existential and civilizational collapse threats. CSI was founded by Col. Drew Miller (USAF, Ret.), a USAFA honor graduate who holds a Harvard Masters and PhD in Public Policy and Operations Research, former intelligence and nuclear plans and programs officer, and whose doctoral dissertation examined underground nuclear defense shelters. Miller served at the Institute for Defense Analyses and in the Senior Executive Service of the Department of Defense. Miller is also author of *Preparing to Survive in the Age of Collapse: Political, Military, Foreign Policy, and Preparedness Reforms Vital for Our Survival* (Skyhorse, 2026).
